

AgentEarn Oracle — Pitch Deck

AgentEarn Oracle

An agent that helps other agents earn — paid on-chain

Imperial AI Agent Hackathon · Solana × CoralOS track

Charlie Morrison · @CharlieMor6296

The problem

The agent economy has a discovery gap.

- Thousands of tasks, bounties and gigs now pay stablecoin direct to a wallet.
 - But an agent can't tell which lanes are honestly open to agents vs human-only, which pay without KYC, or where the expected value actually is.
 - Every earning agent re-solves the same upstream problem: where do I bid, and is it worth it?
-

The product

A seller agent whose product is a verified, freshly-scored feed of "agent-allowed earning opportunities" — sold to other buyer-agents, settled through Solana escrow.

```
feed          → fresh AGENT_ALLOWED opportunities
feed <skill>   → filtered to writing | dev | security | ...
score <slug>   → verified row + LLM fit / competition / EV read
```

An agent that sells other agents the intelligence they need to earn.

Why it answers the theme

The track theme: "agents that earn — build the thing they buy, and how they compete for it."

- The thing agents buy = a trustworthy earn-feed. That's the product.
 - How they compete = fit + submission-count + EV, scored per row.
 - The data isn't a paid third-party feed — it's a live pipeline this project already runs (12+ days of real Superteam / agent-board recon). We productize a working system, not a mock.
-

Three load-bearing pillars

| Pillar | Kit (World Cup Oracle) | AgentEarn fork |

|-----|-----|-----|

| Verified data | TxODDS de-margined odds | Live Superteam /api/listings, filtered to genuine AGENT_ALLOWED in code |

| LLM | odds → fair line | opportunity → fit / competition / EV read |

| Solana escrow | buyer-released | binds reference = sha256(slug·reward·deadline·nonce) — the on-chain order provably is the feed sold |

It runs — real JSON from live data

`npx tsx run_demo.ts` → no chain, no API key needed to demo the core:

```
earn feed → 4 AGENT_ALLOWED opportunities, low-sub-first
earn score imperial-... → evUsd 263.16, fitScore 71,
  "Strong honest shot: 19 entries for 5000 USDG, 5d runway – bid."
```

Repo: github.com/charlie-morrison/agentearn-oracle

Honest scope

- We claim: a verified, de-duplicated, freshly-pulled feed + an LLM EV read, grounded in live APIs.
- We do NOT claim: guaranteed payout, or that we win listed bounties.
- The product is intelligence — same posture as the kit's "fair line, not a betting edge."

The honesty rule (AGENT_ALLOWED only) is enforced in code, not marketing.

Roadmap

1. On-chain escrow settle on devnet — bind the feed hash to the tx, capture the Explorer link.
2. Add lane #2 (agent-native job boards) to the same scored feed.
3. Subscription grammar: watch <skill> — push a buyer-agent the next high-EV drop.

An agent that helps other agents earn. Built on a pipeline that already works.
